

Project #6
CpSc 8270: Language Translation
Computer Science Division, Clemson University
Final Project: Python Functions & Scope
Brian Malloy, PhD
November 22, 2016

Due Date:

In order to receive credit for this assignment, your submission must be submitted, using the `web handin` command, by 8 AM, Monday, December 5th of 2016. If you are unable to complete the project by the first due date, you may submit the project within three days after the due date with a ten point deduction.

Project Specification:

1. Your solution should handle integer and float values and variables, `print`, `assignment`, and the same expressions as the previous project, including $\{x + y, x - y, x * y, x / y, x // y, x \% y, x ** e, (x), -x, +x\}$; and, $\{x+ = y, x- = y, x* = y, x/ = y, x// = y, x\% = y\}$.
2. In addition, your solution should handle Python functions, as illustrated in Figure 1. In particular, Figure 1a will earn 90%, Figures 1b and 1c will earn an additional 10% each, and the implementation of `global` will earn an additional 10%, for a total of 120%.
3. In all cases, the oracle for correctness is a Python 2.7.n interpreter; that is, your expressions should evaluate, sans extended precision, to the same result that a Python 2.7.n interpreter would produce.
4. In the directory that contains your working interpreter, place a new directory titled `cases` that contains test cases that adequately test your interpreter.
5. Write a test harness, `test.py`, and place it in your project folder so that it runs the test cases in `cases`.
6. Your code should be well organized, formatted, readable, free of memory leaks, and exploit proper object orientation.
